

TonalPlan

A weight converter and AI-style workout planner for the Tonal home gym.

Overview

TonalPlan is a web app for people who train on a Tonal. It solves two problems: Tonal's digital resistance *feels* heavier than the same number in free weights, and building effective, equipment-appropriate workouts is tedious. TonalPlan converts weights both ways, learns each user's personal conversion from their own logged lifts, and generates complete, Tonal-native workouts from a plain-language goal — drawing on the full 315-movement Tonal catalog.

What it does

- **Weight converter.** Converts Tonal digital weight $\leftrightarrow$ free-weight equivalent in both directions, using a research-based formula or the user's own data when available.
- **My Lifts.** Log what a Tonal weight felt equivalent to in free weights; the app averages entries into a personal multiplier per exercise that sharpens future conversions.
- **Goal-driven Workout Creator.** Describe a goal (“more distance on my golf drive,” “stronger chest”) and get a full warmup $\rightarrow$ blocks $\rightarrow$ finisher $\rightarrow$ cooldown session using only moves your equipment supports, with suggested starting weights from your own history.
- **Movement Library.** The complete 315-move Tonal catalog, searchable by name, muscle, movement pattern, or accessory, with an “only my equipment” filter.
- **Edit & personalize.** Rename workouts, edit descriptions, and swap any movement for a similar-muscle alternative; each generation varies so plans stay fresh.
- **Cross-device accounts.** Email/password sign-in with data synced across phone and laptop; a live sync indicator shows save status.
- **Export to Tonal.** “Copy for Tonal” produces a clean build sheet to recreate any workout in Tonal's own Custom Workouts feature.

How it works

The workout engine never invents exercises: it filters the curated movement database to the user's owned accessories, scores each candidate against the words in their goal (muscles, patterns, and training intent), and assembles a balanced session — capping repetition so a workout isn't three near-identical presses. Personal conversion data feeds both the converter and the suggested loads.

At a glance

Platform	Responsive web app (works on phone and desktop)
Front end	Single-page vanilla HTML / CSS / JavaScript
Back end	Supabase — Postgres, authentication, row-level security
Hosting	Vercel, auto-deployed from GitHub

Catalog	315 Tonal movements with muscle, region & accessory tags
Privacy	Each account can only read and write its own data

Status

Live and in active development. Converter, personal lift log, accounts and sync, the full movement library, and the workout creator with editing and export are all built and working. The next area of focus is deeper per-movement customization (sets, reps, and load).
